Create a network relationship graph showing the connections between the source IPs and destination IPs of all attacks that started in the most recent day by attack type.

New

Now I'll create a network graph showing these connections, colored by attack type.

This network graph visualizes all attack connections from November 13, 2009, with nodes sized by activity frequency and edges colored by attack type.

Color Legend:

- Red (#d0021b) — Failed attacks / IS exploits
- Orange (#f5a623) — Noisy/DNS-based attacks
- Blue (#4a90e2) — C2 (Command & Control) / Compromise chains
- Purple (#8c1b6b) — DDoS attacks
- Green (#7ed321) — Nmap reconnaissance scans
- Dark Red (#d05c5c) — Router-based attacks

Key Observations:

- 172.28.4.7 is the most targeted IP (huge node), hit by 13 DDoS sources
- 195.171.85.28 is the most active scanner (large node), probing 13 internal IPs
- 25.178.184.105 and 155.25.121.118 are focused on IS exploits against a cluster of IPs
- C2 and compromise activity shows bidirectional traffic (172.28.212.6 -- 20.21.128.84)

F SQL used — 2 queries

Create a network relationship graph showing the connections between the source IPs and destination IPs of all attacks that started in the first day, by attack type.

New

Now I'll create a comprehensive network graph from this first day data. Given the large number of connections, I'll focus on the most significant ones and group less frequent connections.

Attack Summary for November 3, 2009 (First Day):

The network reveals a **coordinated multi-stage attack campaign**:

- Massive DDoS Wave** (Purple edges): 76 external sources bombarding 172.28.4.7 with 9 connections each — the primary victim of coordinated flooding attacks.
- Phishing & Post-Compromise Chain** (Orange edges): External phishing server 115.240.12.124 infects multiple internal IPs (172.28.10.68, 172.28.128.5, 172.28.192.5, 172.28.1.5), which then beacon back to C2 servers.
- Botnet Control Infrastructure** (Red edges): 201.89.32.16 (botnet C&C) and 68.91.226.37 (malware distributor) coordinate compromises across 30+ internal IPs for spam bot and malware DDoS operations.
- IS Exploitation** (Red): 153.25.121.118 probes multiple servers targeting ASP overflow vulnerabilities.
- Nmap Reconnaissance** (Green): 195.171.85.28 systematically scans internal 172.28.18.x subnet (13 targets).
- Bidirectional C2 Channels** (Blue): Internal compromised hosts maintain persistent C2 connections to external servers with exfiltration and remote command execution capabilities.
